From Idea To Reality - App Using AI

Final project

I am very proud of what you have achieved so far.

Now is the time for you to make a project of your own. It's your 'baby'. Make it as impressive as you can.

- Before you start working, please create a private github repository and invite me to it. Remember to keep committing and pushing to the repository while you are developing. If you are working in a team, make sure both members do git commits.
- Remember to work using trello in the way we discussed.

You should create a working project. As we discussed, do not make a trivial project. Add some interesting things like your own interesting logic/ calling of multiple services/tools/apis/ data collection. Make something that you will gladly show to your family, friends and in job interviews.

Your website/app/extension etc should have some kind of analytics (for example smartlook, mixpanel,amplitude, google analytics etc) so you can see and measure how people use your product even if that product is on your pc and you let people play it. Remember that many of these services are blocked by ad blockers so make sure to check them without ad blockers.

You need to create a 5-minute (or less) video that includes:
- Your idea name and a one liner that explains it.
- List of the major features that you implemented.
- A basic diagram of which apis/tools/libraries you used and a brief explanation of the flow(which api is called when etc).
- A recording of the whole project with all of its features running.

Of course please make sure that this video isn't in low resolution and that the quality is ok.

Submission:
Upload the video to google drive, create a link that anyone can view.
Upload to moodle:
1. A pdf file with the link to your video, a link to your github repository and a link to your trello board.
2. The source code of your project zipped into a finalproject.zip file.
